Activity: Assessment Using Testing

Suppose that you are a paraprofessional in a 5th-grade math course in which the subject of measuring angles is being explored. The teacher wants you to assess a cross-section of the class of 25 on whether they understand the concept of finding congruent angles through the means of measuring.

Devise a test that can measure this task of measuring and comparing. Set up a two-step rubric, with one step measuring the protractor proficiency and the other step comparing accuracy, which will give the teacher usable data on how well the students are performing.
